EDUCATION

University of Houston
Bachelor of Science
Major in Computer Science, Minor in Mathematics

Houston, TX
December 2025

WORK EXPERIENCE

KwickPOS

IT Specialist

Houston, TX

January 2026 - Present

- Installed, configured, and maintained POS environments across Windows-, Android-, and Linux-based terminals, including receipt printers, cash drawers, barcode scanners, and payment devices (PAX A35/A920/S300, MagTek).
- Debugged POS application failures by analyzing logs, configuration data, device states, and network behavior, resolving 20+ support tickets daily and documenting root causes for recurring issues.
- Performed device provisioning, software/server updates, terminal initialization, pre-deployment setup, and remote/on-site technical support for merchants, agents, and distributors to ensure successful POS deployment and operation.

PROJECTS

AI Job Application Tracker

May 2026 - Present

Created using Google Sheets, Google Apps Script, JavaScript, OpenAI API, Google Workspace automation

- Built an automated job application tracker that eliminates manual data entry by parsing job posting links into company, role, location, source, status, confidence, and notes.
- Reduced job-search tracking friction with auto-parse triggers, date filters, stale-application detection, and a dashboard for reviewing application volume, status trends, and response progress.
- Improved reliability and cost efficiency by combining local job-posting parsers with OpenAI fallback only when extracted data is incomplete or uncertain.

TimeScout: AI-Assisted Watch Marketplace Aggregator

April 2026 - Present

Created using Next.js, TypeScript, MySQL, Drizzle ORM, Python, scikit-learn, Reddit API, OpenAI API

- Built a full-stack marketplace aggregator for r/Watchexchange to convert unstructured Reddit posts into searchable watch listings with normalized brand, reference, condition, price, sold status, bundle status, and watch type fields.
- Designed a hybrid extraction pipeline to handle noisy seller text by combining regex parsers, Reddit flair/body/OP-comment parsing, TF-IDF logistic-regression classifiers, confidence thresholds, and optional OpenAI-based classification.
- Improved data reliability across 3,000+ listings by adding field-level provenance, manual review queues, reviewed-unknown handling, price precedence rules, stale flag cleanup, gold evaluation cases, and retraining/backfill workflows.

Olympus: ML Model-Audit Platform for Market Signal Research

March 2026 - Present

Created using Python, pandas, scikit-learn, XGBoost, Streamlit, yfinance, Financial Modeling Prep API, VADER Sentiment, pytest

- Built an end-to-end ML research platform that turns noisy market, price, volatility, trend, cross-asset, and sparse news/sentiment data into 42,000+ structured feature rows across a configurable 35-asset universe.
- Solved ML validation issues by designing a model-audit pipeline with chronological splits, next-open execution targets, SPY leakage protection, calibration, walk-forward retraining, baseline comparisons, ranking-alpha analysis, and backtest reports.
- Improved trust in model outputs by adding sparse-feature pruning, automated pass/monitor/fail deployment audits, Streamlit model-health dashboards, portfolio export tooling, and a 72-test pytest suite that rejects weak trading signals.

Web-Based User Management System

January 2025 - April 2025

Created using Flask, HTML, CSS, JavaScript, PostgreSQL, Microsoft OAuth 2.0, Docker

- Architected a scalable academic workflow system using Flask and PostgreSQL that processes form submissions through customizable approval hierarchies, featuring dynamic PDF generation with LaTeX templates and digital signature integration.
- Implemented comprehensive authentication and security using Microsoft 365 OAuth2, building role-based access control across Department Counselors, Academic Directors, and College Supervisors with custom permission decorators.
- Engineered an administrative interface with a configurable workflow engine for managing approval sequences, role-specific permissions, and real-time submission monitoring.

SKILLS

Languages: Python, TypeScript, JavaScript, SQL, PHP, C++, C#, HTML/CSS

Frameworks & Libraries: Next.js, React, Flask, scikit-learn, XGBoost, pandas

Databases & Tools: MySQL, PostgreSQL, Drizzle ORM, Docker, Git, pytest, Google Apps Script

Platforms & Concepts: Linux, REST APIs, OAuth 2.0, ETL Pipelines, Machine Learning, Database Design
